

# DOWNLOAD CRMS VEGETATION ANALYTICAL TEAM FRAMEWORK METHODS FOR COLLECTION DEVELOPMENT AND USE OF VEGETATION RESPONSE VARIABLES

## **crms vegetation analytical team pdf**

vegetation analytical teams plan to summarize their results in the form of written reports and/or graphics and present these items to CRMS Federal and State sponsors, restoration project managers, landowners, and other data users for their input.

## **CRMS Vegetation Analytical Team Framework: Methods for**

This document identifies the main objectives of the Coastwide Reference Monitoring System (CRMS) vegetation analytical team, which are to provide (1) collection and development methods for vegetation response variables and (2) the ways in which these response variables will be used to evaluate restoration project effectiveness.

CRMS Website Roadshow. Data/Visualization ... Vegetation Volume (m<sup>3</sup>) = [ (herb layer area (m<sup>2</sup>) \* herb height (m)) ... CRMS Analytical Future Direction The analytical teams will meet with the MWG to present recommendations for additional metrics and future data manipulations.

## **CRMS Website Roadshow - LaCoast.gov**

A CRMS analytical team has tailored these data into an index much like the Floristic Quality Index (FQI) currently used for herbaceous marsh and for the herbaceous layer of the swamp vegetation. The core of the FFQI uses basal area by species to assess the quality and quantity of the overstory at each of three stations within each CRMS forested wetland site.

CRMS Roadshows are scheduled for the federal sponsors to provide feedback on the products provided by the website team. CRMS website training is available to restoration professionals as

## **CRMS Update to the CWPPRA Task Force**

The CRMS Vegetation Analytical Team has developed a Floristic Quality Index (FQI) for coastal Louisiana to determine the quality of a wetland based on the composition and abundance of its herbaceous plant species (Cretini et al., 2012).

## **Floristic Quality Index and Forested Floristic Quality**

Simulation-based process models suggest that marsh stability is the product of a complex feedback between sediment supply, flooding regime and vegetation response, resulting in elevation gains sufficient to match the combination of relative sea-level rise and losses from erosion.
