SUMMARY The cytology of sixteen species of ferns indigenous to South India has been studied. The chromosome numbers in all these species are being recorded for the first time. The existence of more than one cytotype in South India has been observed in *Cyclosorus interruptus* (Willd.) Iko. Apogamy has been demonstrated in *Dryopteris boryana* (Willd.)

Twenty species out of a total of twenty-six leptosporangiate ferns known to occur on Tristan da Cunha have been examined cytologically. Four species have been independently examined from Gough with concordant results. *Hymenophyllum tunbrigense*, included among the Tristan species, is a new record for the island.

### **Cytology of the fern flora of Tristan da Cunha**

the change in status of exfoliative cytology from a research project to an established diagnostic method. The 1950 annual report noted that the laboratory successfully completed its first year under Dr. Fennell, and exfoliative cytology is described as "indispensable in the diagnosis
