Reflection high-energy electron diffraction is sensitive to many of the microscopic processes that occur during crystal growth. The diffracted beams broaden and the peak exhibits intensity variations due to changes in the defect and morphological structure of the surface during epitaxy.

Furthermore, electron diffraction in TEM can be combined with direct imaging of the sample, including high resolution imaging of the crystal lattice, and a range of other techniques.

Electron diffraction - Wikipedia

Reflection high-energy electron diffraction (RHEED) is a technique used to characterize the surface of crystalline materials. RHEED systems gather information only from the surface layer of the sample, which distinguishes RHEED from other materials characterization methods that also rely on diffraction of high-energy electrons.
