It uses electroencephalography to understand how exactly user quality judgments are formed within a test participant, and what might be the physiologically-based implications when being exposed to lower quality media.

Neural Correlates of Quality During Perception of

Assessing speech quality perception is a challenge typically addressed in behavioral and opinion-seeking experiments. Only recently, neuroimaging methods were introduced, which were used to study the neural processing of quality at group level. However, our electroencephalography (EEG) studies show that the neural correlates of quality ...

the equation: the things of which neural correlates are meant to be neural correlates. Neuroscientists can't brush them aside, though, lest their brain imaging results fail to refer to those things.

The neural correlates of consciousness constitute the minimal set of neuronal events and mechanisms sufficient for a specific conscious percept. Neuroscientists use empirical approaches to discover neural correlates of subjective phenomena. The set should be minimal because, under the assumption that the brain is sufficient to give rise to any given conscious experience, the question is which of its components is necessary to produce it.

Humor is a uniquely human quality whose neural substrates remain enigmatic. The present report combined dynamic, real-life content and event-related functional magnetic resonance imaging (fMRI) to dissociate humor detection (getting the joke) from humor appreciation (the affective experience of mirth). During scanning, subjects

investigate the neural correlates of training and transfer, which can be used to identify how brain characteristics are manifested in individual differences in training and transfer outcomes. Recent studies have successfully identified structural, metabolic, and functional correlates of training and transfer.

Abstract. The role of the frontal cortex in consciousness remains a matter of debate. In this Perspective, we will critically review the clinical and neuroimaging evidence for the involvement of the front versus the back of the cortex in specifying conscious contents and discuss promising research avenues.
